

Modify Requester LOV

Sample Use Case: Restrict public persons to only those who belong to the same BU as the BU in the primary work assignment of the logged in user.

Introduction:

Public Person records are records that all workers have access to. For example, Preparers while creating requisitions, can search the Requester LOV to pick a user that they want to order items for. Self Service Procurement users can also search the Requester LOV to pick people that they want to reassign a requisition to. Typically, the Requester LOV gives access to all those with an active primary assignment record.

It is possible to restrict the records returned in the Requester LOV i.e. to stop it from returning everybody with a primary active assignment record. In this document, we will show how to only return users who belong to the same requisitioning BU as the BU of the primary work assignment of the logged-in user.

Step 1: Duplicate the seeded Procurement Requester, Procurement Preparer, Advanced Procurement Requester and Employee roles

Security Console > Employee > Copy > Copy top role and inherited roles

Note:

- a) At the minimum, you need to duplicate the Procurement Requester and Employee roles

Employee role inherits Procurement Requester role by default.

- b) If you use Procurement Preparer and Advanced Procurement Requester roles in your organization, then duplicate those too

Procurement Preparer inherits Procurement Requester role while the Advanced Procurement Requester inherits the Procurement Preparer role

Tip:

- a) Duplicate the Employee role first and if you choose 'Copy top role and inherited roles', it will also duplicate the Requester role

Step 2: Create a custom person security profile

Setup and Maintenance > Manage Person Security Profiles

Manage Person Security Profiles

Search

* Name

Search Results

View Format **+ Create** Edit Export

Name	Enabled	View All	Access to Own Record	Secure by Area of Responsibility	Secure by Person Type
No search conducted.					

Columns Frozen 1

Tick the 'Secure by Custom Criteria' checkbox and enter the SQL below

Note: First copy the SQL to Notepad, save it and then copy from Notepad into Oracle Application or directly type in the SQL into Oracle Application. Copying from Notepad ensures the characters are in Unicode.

&TABLE_ALIAS.PERSON_ID IN

```
(  
  SELECT PERSON_ID FROM PER_ALL_ASSIGNMENTS_M WHERE BUSINESS_UNIT_ID IN  
  ( SELECT business_unit_id FROM per_all_assignments_m AM  
    WHERE AM.person_id =(SELECT HRC_SESSION_UTIL.GET_USER_PERSONID FROM DUAL)  
    AND trunc(sysdate) between AM.effective_start_date and AM.effective_end_date  
    AND AM.EFFECTIVE_LATEST_CHANGE='Y' AND AM.PRIMARY_FLAG='Y'  
    AND AM.ASSIGNMENT_STATUS_TYPE IN ('ACTIVE', 'SUSPENDED') )  
  AND trunc(sysdate) between effective_start_date and effective_end_date  
  
  AND EFFECTIVE_LATEST_CHANGE='Y'  
  AND PRIMARY_FLAG='Y' AND ASSIGNMENT_STATUS_TYPE IN ('ACTIVE', 'SUSPENDED')  
)
```

Step 3: Assign the custom person security profile to the newly created Procurement Requester and Employee Roles

A) For the Requester role

Setup and Maintenance > Manage Data Role and Security Profiles > Person Security Profile > <NEW_PERSON_SECURITY_PROFILE>

Edit Data Role: Security Criteria

Role Procurement Requester ReqBU2

Organization

* Organization Security Profile View All Organizations

- Secure by Organization Hierarchy
- Secure by Organization Classification
- Secure by Organization List

Public Person

* Person Security Profile Custom_By_RequisitioningBU

- Secure by Area of Responsibility
- Secure by Person Type
- Secure by Manager Hierarchy
- Secure by Department
- Secure by Business Unit
- Secure by Legal Employer
- Secure by Position
- Secure by Legislative Data Group
- Secure by Payroll
- Secure by Global Name Range
- Secure by Custom Criteria

B) For the Employee role

Setup and Maintenance > Manage Data Role and Security Profiles > Public Person > <NEW_PERSON_SECURITY_PROFILE>

Edit Data Role: Security Criteria

Role Employee

Organization

* Organization Security Profile View All Organizations ▼

- Secure by Person Type
- Secure by Manager Hierarchy
- Secure by Department
- Secure by Business Unit
- Secure by Legal Employer

Step 4: Remove the seeded Data Security Policies (DSP) from the new Procurement Requester role (*this will leave just the new DSP we assigned to the role in Step 3*)

Security Console > [NEW_PROCUREMENT_REQUESTER_ROLE] > Edit Role> Data Security Policies

Filter by Data Resource = Public Person

You will see all DSPs assigned to Public Person including one bearing the name of the person security profile you created. Remove all the others

Edit Role Procurement Requester Custom by BU: Data Security Policies				
		Public Person		
Policy Name	Policy Descriptio	Data Resource	Privilege	Condition
POR_PROCUR... requester can choose	POR_PROCUR... requester can choose public person	Public Person	Choose Public Person;	HCM:PER:PER_PERSONS:CustomByBU

Step 5: Remove the seeded DSPs from the new Employee role (leaving only the new DSP which you assigned in Step 3)

Security Console > [NEW_Employee_ROLE] > Edit Role> Data Security Policies

Filter by Data Resource = Public Person

Edit Role Employee Custom by BU: Data Security Policies				
Policy Name	Policy Description	Data Resource	Privilege	Condition
PER_EMPLOYEE... can view person career planning	PER_EMPLOYEE... can view person career planning	Public Person	View Person Career Planning;	HCM:PER:PER_PERSONS:CustomByBU
PER_EMPLOYEE... person skills and qualifications can vie	PER_EMPLOYEE... person skills and qualifications can view person skills and qualifications for people and assignments in their public person and assignment security profile	Public Person	View Person Skills and Qualifications;	HCM:PER:PER_PERSONS:CustomByBU

Notes

- a) Employee role has several DSP for the Public Person data resource
- b) Each of the seeded ones have to be removed leaving only the ones from the new DSP assigned in step 3
- c) One way to simplify this task is to filter by each value in the privilege column. This will give you the seeded rows and the newly assigned rows. You then delete the seeded rows. For example filter by ‘View Person Career Planning’, ‘View Person Skills and Qualifications’, etc

Step 6: Assign the new employee role to your users and remove the old employee role from them
